

## **NAMM 2012 B2B XML Implementation Guide**

**Revision 1.3d – Last modification: Oct 26, 2012**

# Executive Overview

In today's challenging and uncertain economy, finding efficiencies and cost savings in your business processes is imperative, and the shortest path to savings is the adoption of standard transaction formats. Whether you are a manufacturer, a distributor, or a retailer, you can streamline and automate the production of orders, product catalogs, shipping documents, and forecasts using industry standards.

## Five Reasons to Adopt Industry Technology Standards

1. **Your business will benefit from increased efficiency.** Trading partners who share information through standardized data exchange enjoy reduced operational costs as a result of less human interaction in business transactions.
2. **Your business will profit from higher accuracy.** Using standardized transaction formats allows business trading partners to easily share information, thereby preventing costly mistakes.
3. **You will be able to provide better customer service.** Access to timely information in known, predictable formats allows for faster response time and better service to your customers.
4. **You will be able to make better decisions.** Timely, accurate, and complete information gives you the "big picture" you need to make informed business decisions.
5. **Your business communications will be simpler.** A standardized, agreed-upon data transfer format simplifies transactions between business partners and removes obstacles imposed by the businesses' individual systems.

Product vendors, suppliers, and purchasers use different computer hardware and software systems to process their business transactions. These systems all have their own proprietary internal data formats, and yet they all need to process the same kinds of data. Thus, the need for a "common language" for sharing data among business trading partners becomes critical. More efficient and reliable data transfer means fewer errors in your business transactions, and that means a better bottom line!

The common format that makes this possible is called XML (eXtensible Markup Language). XML is a method of semantically classifying, annotating, and storing data so that it can be shared among dissimilar systems, yet interpreted and processed identically by them. XML data conforms to formatting rules that are agreed to by all parties to a transaction, and thus can be freely exchanged among disparate hardware and software systems without fear of misinterpretation, data loss, or exposure of proprietary information.

XML is the *de facto* data storage and communication format in business today, and it is the format used by NAMM's Business to Business (B2B) document set. Using XML-based data, business trading partners can exchange information consistently and precisely, improving efficiency and accuracy while reducing operational costs and enhancing all levels of customer service. XML's common data format facilitates the ability to share information among business partners throughout the supply chain.

For example, XML data:

- can be used across all computer platforms
- integrates with a wide range of software applications
- is robust enough to convey complex information, yet simple enough to read
- is a mature technology used by companies large and small all over the world
- does not require specialized resources to implement

For the past several years, experts from across all channels of the Music Products Industry have partnered together to design a tool to enhance your business practices. That tool is the NAMM B2B XML standard, the most widely used standard in the Global Music Products Industry. This document details the information necessary for trading partners like you to begin to implement and automate transactions using this standard. NAMM encourages you and your business partners to adopt and use these standardized data transfer formats. Visit us at [www.namm.org/initiatives/b2b](http://www.namm.org/initiatives/b2b) to learn more.

# Introduction

## ***Abstract***

This document is intended as a conceptual and practical guide to NAMM's Business-to-Business (B2B) XML data exchange standard, and specifically a reference to the XML files defined by the standard.

## ***Audience***

The target audience for this document is the technical team in a musical products merchandising company whose responsibility includes internal software management, configuration, and integration, especially as relates to interfacing with external data sources. These companies may supply musical products, consume them, or both.

## ***Overview***

In the course of providing musical products from one company to another, certain data must be exchanged between suppliers and buyers. While the specific software systems of each company will necessarily differ in platform, connectivity, and functionality, it is highly advantageous to both parties that the structure of the data exchanged be consistent from transaction to transaction. It is this need for structural consistency that is addressed and provided by the NAMM B2B standard.

# Implementation

## ***Transaction Definition***

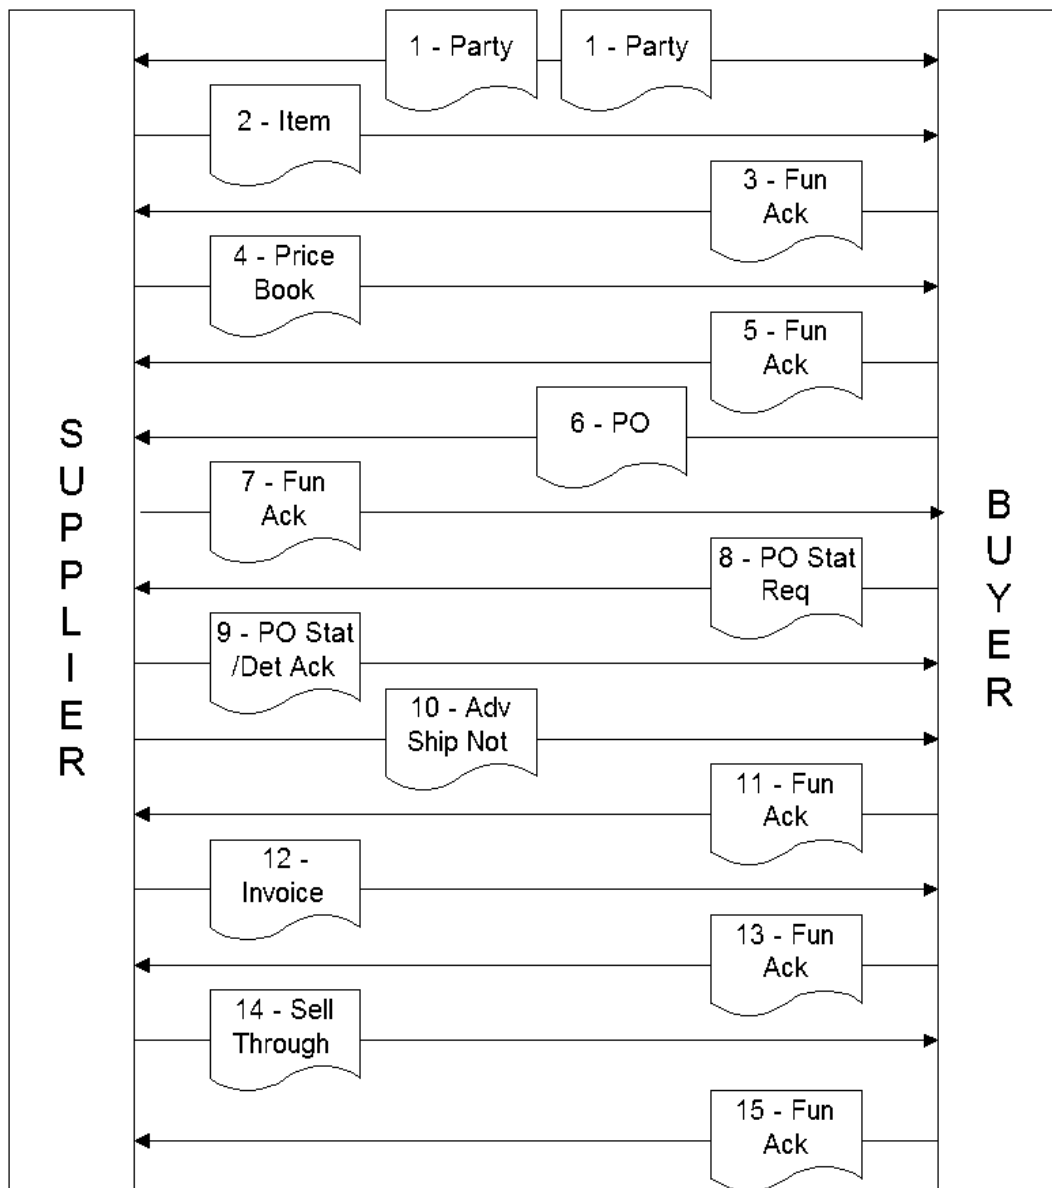

The NAMM B2B standard comprises a set of XML files containing data in a predefined, consistent format. Each XML file is designed to precisely define the data required to complete one common transaction between parties, e.g., Purchase Order, Invoice, Shipment Notification, and so on. These documents are described in “XML Files”, below.

## ***Transaction Sequence***

A typical sequence of events between a product supplier and product buyer and the associated documents, in chronological order, might be as follows.

1. Both supplier and buyer complete and release mutually-available identification information in a **Party** document.
2. The supplier sends a catalog of available products to the buyer in an **Item** document.
3. The buyer acknowledges receipt of the Item document with a **Functional Acknowledgement** document.
4. The supplier sends a price list for available products to the buyer in a **PriceBook** document (optional).
5. The buyer acknowledges receipt of the PriceBook document with a **Functional Acknowledgement** document.
6. The buyer decides to purchase items from the catalog and sends a request for them to the supplier in a **Purchase Order** document.
7. The supplier acknowledges receipt of the Purchase Order with a **Functional Acknowledgement** document.
8. The buyer requests the status of their order with a **PO Status Request** document.
9. The seller provides the status of the order in a **PO Status Acknowledgement** document.
10. The supplier makes one or more product shipments to the buyer and sends detailed information for each shipment in an **Advanced Shipment Notification** document.
11. The buyer acknowledges receipt of the Advanced Shipment Notification with a **Functional Acknowledgement** document.
12. The supplier sends a request for payment to the buyer in an **Invoice** document.
13. The buyer acknowledges receipt of the Invoice with a **Functional Acknowledgement** document.
14. The supplier sends a report to the buyer indicating which products have been sold in a **SellThrough** document (optional).
15. The buyer acknowledges receipt of the SellThrough with a **Functional Acknowledgement** document.

Below is a diagram of this process, referencing the step/document numbers above.

*A typical B2B document transaction sequence*

## ***Transport Options***

In the B2B scenario described above, the XML documents must be electronically transmitted between partners in order for data sharing to take place. Therefore, the transmission method used, called a *transport protocol*, must be understood and implemented by both parties to a transaction.

The set of protocols used for Internet communications is called the *Internet Protocol Suite*, commonly known as TCP/IP (Transmission Control Protocol/Internet Protocol). The two most popular transport protocols in use today are HTTP and FTP, discussed below.

## HTTP

HTTP (HyperText Transfer Protocol) can be used to upload (send) files from a local computer to a remote web server. This is the method used to download web pages from a server into a web browser for viewing, and to download auxiliary files from web pages to your local computer. In this scenario, a programmer must implement a system that runs a script or application so the sender can use it to upload a file. When the transfer is complete, the receiving system might then run another program to process the data (e.g., to input it into the company's accounting system). HTTP supports immediate in-session response, enabling the receiving party to validate the transmitted XML and respond by transmitting an XML document of its own (such as a Functional Acknowledgement) back to the sender. This type of transfer is typically used to send one file at a time (or multiple documents in an envelope).

## FTP

FTP (File Transfer Protocol) can also be used to upload files from a local computer to a remote location. In this scenario, the sender runs a specific kind of third-party application called an *FTP client* on their local computer to contact the recipient's server; the FTP client then lets the user select one or more files to transfer and sends them. FTP does not support immediate response; instead, transmitted files may be detected later by other software and managed in groups (*batch processing*). This type of transfer is typically used to send several files at a time.

## HTTP/FTP Comparison

**Transfer speed:** Both protocols have features that increase and decrease transmission speed. For example, while FTP does not take the time to "chunk" files as HTTP does, it uses two connections (one for commands and another for transfers) to accomplish its task. Conversely, while HTTP automatically compresses transmitted data, it adds metadata elements to the transmission stream. Ultimately, when transferring a small number of files that are not individually large (such as those in NAMM's B2B process), the speed difference is negligible.

**Security:** Neither standard HTTP nor FTP supports secure transmission, so each protocol has a secure version – HTTPS and SFTP – that can be used to provide secure file transfer between systems. Because FTP/SFTP, once connected, gives an authorized sender relatively broad access to the recipient's file system, where HTTP/HTTPS does not, additional software safeguards or strictly limited navigation permissions may be required. NAMM members are strongly encouraged to use the secure protocols (HTTPS/SFTP) in their B2B transactions to ensure the security and privacy of their communications.

**Popularity:** FTP is a much older system than HTTP, by a decade or more. Thus, historically speaking, FTP is more popular. However, because today virtually every page – and virtually every upload and download link – on the web is now served via HTTP, it is accurate to say that HTTP is by far the more popular protocol in terms of raw usage. Further, while there are many excellent and free FTP clients available (FireFTP, FileZilla, CoffeeCup Free FTP, WinSCP, etc.), HTTP/HTTPS is significantly easier to control and customize programmatically via browser scripting or programming languages, making it the most popular choice for developers of modern file transfer applications.

## Conclusion

XML files contain only "plain text" data, and thus are compatible with any transfer protocol. Which protocol you use is ultimately up to you and your business partners. You may in fact use both protocols to share data among partners, FTP for some and HTTP for others; or you might use FTP to send files and HTTP to receive them. The choice depends on what software you and your partner companies have available or are willing to develop.

## Resource Requirements

Implementing the NAMM B2B standard is not difficult and does not require specialized resources. Most likely, your company already has the basic facilities and resources required for implementation, such as:

- a web server that supports FTP or HTTP transport services
- an internet connection/hosting facility
- a domain name (or IP address)
- commercial or proprietary accounting software
- a software and/or web developer

You can get additional help with B2B planning and implementation at the NAMM web site (<http://www.namm.org>), through independent consultants, and from certain 'point-of-sale'[POS] solution providers. POS solutions are widely used in the music products industry.

There are also many completely free XML tutorials, services, and utilities available online, such as the World Wide Web Consortium's (W3C) W3Schools training site (<http://w3schools.com/xml/default.asp>), XML editors like Microsoft's XML Notepad (<http://www.microsoft.com/download/en/details.aspx?id=7973>), and web-based validation tools such as DecisionSoft's online XML Schema Validator (<http://tools.decisionsoft.com/schemaValidate/>).

For more information or to ask specific questions, please email us at **[b2b@namm.org](mailto:b2b@namm.org)**.

# XML Files

## *Usage Note*

Below are descriptions and discussions of the XML documents currently defined by the NAMM standard. Note that, as with any XML implementation, these files merely define the structure of the data and do not require nor support any specific processing agents (i.e., application software). The responsibility for creating, validating, transmitting, receiving, and parsing the files and their content therefore rests solely with the business entities (suppliers and buyers) using them. To facilitate validation, each XML document has an accompanying file that contains the document's specific, clearly defined rules, called an XSD schema; see "XML Schemas".

## *Party*

The Party document, **party-v2009.1.xml**, contains general information about the parties involved in the B2B transactions that the parties wish to share with each other. Each party, also called a trading partner, creates a Party document..

The Party document contains public identifying information about one trading partner. However, for added flexibility, multiple trading locations for the partner may be specified in the same document. These locations might be such things as different branch offices, product warehouses, or shipping destinations. Each party and each location includes a unique ID, which may be in GLN (Global Location Number) or NAMM format, plus the partner entity's name, address, phone, email, and other contact information.

## *Item*

The Item document, **item-v2011.1.xml**, essentially contains a catalog of items available for sale. The supplier creates this document and provides it to prospective buyers.

The Item document structure is reasonably "flat", presenting salable items in a simple hierarchy with few levels. Each item has many possible descriptive characteristics, most of which are optional, but which provide ease of description for virtually any product, including packaging, origin, and warranty information.

## *Functional Acknowledgement*

The Functional Acknowledgement document, **funack-v2009.1.xml**, is a simple notification from party to party acknowledging the receipt of another transaction such as an item document, purchase order, advanced shipment notice, or invoice. It may also provide information indicating the status of the transactional document. This document is used repeatedly throughout the supply chain.

## *Price Book*

The Price Book document, **pricebook-v2011.0.xml**, contains pricing information for various items offered by the supplier. It can specify price changes (breaks) at different purchase tiers (e.g., 1-100 units, 101-500 units, etc.) as well as indicate units of measure (UOM) for the tiers. This document is optional, and is in beta testing as of this writing.

## *Purchase Order*

The Purchase Order document, **po-v2009.2.xml**, contains a list of items the buyer has selected for purchase from the supplier.

The Purchase Order document first provides basic information about the proposed sale, such as buyer, billing, and supplier data. It then provides overall sale specifics, such as terms and shipping instructions. Finally, it provides a shipping location and a list of ordered items.

## ***Purchase Order Status Request***

The Purchase Order Status Request document, **postatusrequest-v2011.0.xml**, requests from the supplier the status of an outstanding Purchase Order. In fact, the status of multiple Purchase Orders may be requested in one transaction, thus obviating the need for multiple requests. This document is in beta testing as of this writing.

## ***Purchase Order Status / Detail Acknowledgement***

As evidenced by its name, the Purchase Order Status / Detail Acknowledgement document, **postatus-v2011.0.xml**, is a dual-purpose transactional document. It may be transmitted from supplier to buyer as a detailed acknowledgement of a submitted Purchase Order (in lieu of a Functional Acknowledgment as shown in step 7, above). It may also be sent as a status report for a buyer's Purchase Orders, generated either periodically or in specific response to a Purchase Order Status Request. This document is in beta testing as of this writing.

## ***Advanced Shipping Notice***

The Advanced Shipping Notice document, **asn-v2009.2.xml**, contains detailed information about one or more orders in progress from supplier to buyer. It may be requested via the Purchase Order document, and provides specific partial or full order shipment details, enabling the buyer to reconcile items ordered with those actually received.

## ***Invoice***

The Invoice document, **invoice-v2011.1.xml**, is a supplier's request for payment from the buyer. It contains information about the supplier, payee, and buyer, as well as invoice terms and detailed information about the referenced purchase, down to the individual items.

## ***Sell Through***

The Sell Through document, **sellthrough-v2012.1.xml**, is an optional post-transaction report sent by the buyer to the supplier, indicating what products have been sold, to which locations, for what price, etc. This document is discretionary and informational only, and thus does not trigger any further action, acknowledgement, or event. This document is in beta testing as of this writing.

# XML Tag Reference

## Coding Note

Below are tag-by-tag listings of each XML document in the NAMM B2B standard. Each tag is followed by a brief description and a flag indicating whether the tag is required in the particular document. Nested tags are indented to indicate the hierarchical structure of the documents.

Complex (parent) elements are shown here as separate start and end tags (e.g., <Location> ... </Location>), while simple (child) elements are shown as “empty” tags (e.g., <Name/>) for improved readability in this document. These tags would of course be coded in live documents with start tags, data, and end tags (e.g., <Name>MusicMax Corporation</Name>).

While most pertinent metadata in these documents is coded as nested tags (e.g., <Barcode> <ID>4959112079274</ID> <Type>GTIN-13</Type> </Barcode>), some metadata is coded instead as attribute/value pairs (e.g., <Price type="MSRP" Currency="USD">980.00</Price>). Attributes are shown here on separate lines below the tags to which they belong (as nested tags would be, except without enclosing <>s), and their descriptions begin with the notation "Attribute:".

Elements and attributes required by the XSD schemas are marked with an X in the **Req** column. If a child element or attribute is marked required but its parent element is not, it means that the parent is still optional but, if used, it must contain the required child elements or attributes.

**Important Note:** Most of the XML tags used in these files are mixed-case, as in <PartyIdType>; this coding technique is valid XML, and is used by design to improve human readability. However, XML code is case-sensitive, so users must be exceptionally careful to maintain proper tag case when creating and processing these files within their own editors, applications, and systems.

# XML Schema Definitions (XSDs)

## Usage Note

An XML Schema Definition (XSD) describes the valid structure of an XML document. The schema is the successor to the Document Type Definition (DTD), and is the current recommendation of the World Wide Web Consortium (W3C). Below are the XSD files associated with each document type in the NAMM B2B standard. These schemas should be used for validation when creating/modifying, sending, receiving, and reading/importing the XML documents in order to avoid transmitting an invalid document to, or receiving one from, another business partner.

The schemas as presented here do not use the optional `targetNamespace` attribute on the `schema` tag; they have only the `xmlns:xs` attribute, defining the “xs” prefix, like this:

```
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
```

Therefore, when referencing the schemas from a NAMM B2B XML data document, you should use the `xsi:noNamespaceSchemaLocation` attribute instead of the `xsi:schemaLocation` attribute on the top-level tag to specify the location of the schema.

For example, assume that the schemas all reside in a folder on the NAMM web site called `http://b2b.namm.org/B2B/Schemas`. If the schema for the Party document is named **party-v2009.1.xsd**, then the reference to it in the Party document's top-level tag would look like this:

```
<NAMM_PARTY version="2009.1"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation=
    "http://b2b.namm.org/B2B/Schemas/party-v2009.1.xsd">
```

Such a reference would allow connection to and validation through the associated schema.

One additional coding note: Because the default value for both the `minOccurs` and `maxOccurs` attributes is “1”, `minOccurs="0"` has been included only when necessary, to indicate optional elements.

## Party – party-v2009.1.xsd

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="NAMM_PARTY">

# Sample XML Documents

## Usage Note

Below are samples of each XML document in the NAMM B2B standard, containing correctly coded tags and example data. Note that while these samples may contain some accurate-looking partner information, they are not actual partner documents and should not be construed as such. Use these sample documents as examples of how each document type might be coded. Note that while all required elements are present in these examples, optional elements may or may not be included.

P998				USE DISCOUNT AND DAYS NODES
P999				USE CUSTOMER DEFAULT

### Inco Terms Codes

The International Chamber of Commerce (Inco) shipping terms codes reproduced below are used in the Invoice and Purchase Order documents.

Code	Description
<b>Group E: Departure</b>	
EXW	EX Works
<b>Group F: Main carriage unpaid</b>	
FCA	Free Carrier

FAS	Free Alongside Ship
FOB	Free On Board
<b>Group C: Main carriage paid</b>	
CFR	Cost and Freight
CIF	Cost, Insurance and Freight
CPT	Carriage Paid To
CIP	Carriage and Insurance Paid to
<b>Group D: Arrival</b>	
DAF	Delivered At Frontier
DES	Delivered Ex Ship
DEQ	Delivered Ex Quay
DDU	Delivered Duty Unpaid
DDP	Delivered Duty Paid

## Shipping Codes

The shipping codes reproduced below are used in the Purchase Order and Advanced Shipping Notification documents.

Code	Description	Carrier	Time
S001	UPS/Ground	UPS	Ground
S002	UPS/Next Day Air	UPS	1DayAM
S003	UPS/2nd Day Air	UPS	2Day
S004	UPS/3-Day Select	UPS	3Day
S021	FedEx Ground	FedEx	Ground
S005	FedEx/Next Day Air	FedEx	1DayPM
S006	FedEx/2nd Day Air	FedEx	2Day
S007	FedEx/Next Day Priority Air	FedEx	1DayAM
S008	FedEx/2nd Day Priority Air	FedEx	2Day
S022	FedEx Freight	FedEx	LTL
S024	FEDX/3-Day	FedEx	3Day
S009	Will Call		
S010	Drop Ship/Misc Carrier		
S023	Drop-Ship UPS/Ground Residential	UPS	GroundResidential
S011	Drop-Ship UPS/Ground	UPS	Ground
S012	Drop-Ship UPS/Next Day Air	UPS	1DayAM
S013	Drop-Ship UPS/2nd Day Air	UPS	2Day
S014	Drop-Ship UPS/3 Day Select	UPS	3Day
S015	Drop-Ship FEDX/Next Day Air	FedEx	1DayPM
S016	Drop-Ship FEDX/2nd Day Air	FedEx	2Day
S017	Drop-Ship FEDX/Nxt Day Priority Air	FedEx	1DayAM
S018	Drop-Ship FEDX/2nd Day Priority Air	FedEx	2Day
S019	Drop-Ship FEDX/3-Day	FedEx	3Day
S020	Misc Carrier/Include Remarks		
S031	international AIR shipments		
S032	international LTL shipments		

S033	international OCEAN shipments		
S034	international SMALL PACKAGE shipments		
S035	international TRUCKLOAD shipments		
S998	Use Carrier and Time Codes		
S999	Use Customer Default (Bestway)		

## ***Status Codes***

The status codes reproduced below are used in the Functional Acknowledgement document.

<b>Status Code</b>	<b>Description</b>
C01	Received
C02	Error

## ***Unit of Measurement (UOM) Codes***

The UOM codes reproduced below are used in the Advanced Shipment Notice, Invoice, Item, and Purchase Order documents.

<b>Code</b>	<b>Description</b>
BAG	Bag
BKT	Bucket
BND	Bundle
BOWL	Bowl
BX	Box
CRD	Card
CM	Centimeters
CS	Case
CTN	Carton
DZ	Dozen
EA	Each
FT	Foot
GAL	Gallon
GROSS	Gross
IN	Inches
KIT	Kit
LOT	Lot
M	Meter
MM	Millimeter
PC	Piece
PK	Pack
PK100	Pack 100
PK50	Pack 50
PR	Pair
RACK	Rack
RL	Roll
SET	Set
SET3	Set of 3
SET4	Set of 4
SET5	Set of 5
SGL	Single

SHT	Sheet
SQFT	Square ft
TUBE	Tube
YD	Yard

## ***Product Category Codes***

NAMM maintains a comprehensive list of musical product categories, including category descriptions, level paths, unique code numbers, and inactive dates, for use with the B2B documents. Although the full list of well over 700 categories is too lengthy to publish in this guide, a small sample is shown below.

<b>Code</b>	<b>Level Path</b>	<b>Custom Category Description</b>	<b>Inactive Date</b>
...	...	...	...
1011109364	Accessories >> Audio >> Cables/Connectors >> Jacks, Plugs, Connectors	Jacks, Plugs & Connectors	
1011109520	Accessories >> Audio >> Cables/Connectors >> Power Cables and Cords	Power Cables	
1011159122	Accessories >> Audio >> Parts >> Amplifier Hardware	Amplifier Parts & Hardware	
1011159576	Accessories >> Audio >> Parts >> Speakers - Components	Speaker Parts	
1011167158	Accessories >> Audio >> Power >> Batteries	Batteries	
...	...	...	...

The full list is available online at:

<http://www.namm.org/initiatives/b2b/categories>

The full list is also available online as an XML feed at

<http://www.namm.org/initiatives/b2b/categories/xml>

On this page, right-click and choose "View Source" to see the full XML source code.

An Excel document containing the full list can be downloaded here:

<http://www.namm.org/initiatives/b2b/categories/excel>

## Appendix B: Alphabetical Tag Listing

Any given XML element in the NAIMM B2B standard might appear in multiple documents, making consistent element definition, validation, and use across documents critical. It is therefore useful to be able to determine, for any given tag, the documents and context in which it appears.

Below is an alphabetical list of all XML elements used in the B2B standard documents, the documents in which they appear, their data types, lengths, and any pertinent notes about content, range, source, or values.

Document name abbreviations used in the “Appears In” column are:

- AS = Advanced Shipment Notice
- FA = Functional Acknowledgement
- IN = Invoice
- IT = Item
- PB = Price Book
- PO = Purchase Order
- PR = Purchase Order Status Request
- PS = Purchase Order Status
- PY = Party
- ST = Sell Through

Data type abbreviations used in the “Type” column are:

- C = Complex/Container
- D = Date
- F = Flag (Y/N, C/D, etc.)
- I = Integer
- N = Numeric (decimal)
- S = String
- U = URL/URI

Tag	Appears In	Type	Len	Notes

## Appendix C: XSL Transforms

Although XML is a precise and efficient method for storing and transmitting data, it is certainly not visually attractive and can be difficult for a person to read and understand. A technology called XSLT (eXtensible Stylesheet Language Transformations) exists that allows you to convert (*transform*) the data in an XML document into a more readable, browser-renderable format such as HTML. In a nutshell, XSLT allows you to view an XML data file as though it were a web page.

The basic steps involved in this process are:

1. Write an XSLT transform for a specific type of XML file (e.g., invoice-v2011.1.xml).
2. Associate the two files by adding a reference to the XSLT transform inside the XML file.
3. Open the XML file in a browser; the browser executes the transform, converts the XML to HTML, and displays the result.

While the creation of XSLT transforms is a decidedly technical task, it is not particularly difficult, and can result in attractive and usable document displays. Your company can create transforms that include your own logo, watermark, fonts, and other information, and that cause the data in the "raw" XML file to be organized and displayed in a visual format of your own design.

### The Basics

XSLT files process XML files by matching XML tags to mini-programs called *templates*, which change the XML tags into HTML while retaining the data inside the tags. For example, consider this XML snippet containing some information about a breakfast dish.

```
<?xml-stylesheet type="text/xsl" href="waffles.xsl"?>
<food>
  <name>Belgian Waffles</name>
  <price>$5.95</price>
  <description>Two of our famous Belgian Waffles with plenty of real
    maple syrup</description>
  <calories>650</calories>
</food>
```

The first line of the XML snippet is the reference to the XSLT file to be applied, "waffles.xsl". A portion of that file, an XSLT template to transform that data into a browser-compatible format, might look like this.

```
<xsl:template select="food">
  <p style="background-color:teal;color:white;font-weight:bold;">
    <xsl:value-of select="name"/> -
    <xsl:value-of select="price"/>
  </p>
  <p>
    <xsl:value-of select="description"/>
    (<xsl:value-of select="calories"/> calories)
  </p>
</xsl:template>
```

The XML file then is opened in a browser. The XSLT reference causes the browser to load and process the template, and the generated HTML displayed in the browser then looks like this.

**Belgian Waffles - \$5.95**

Two of our famous Belgian Waffles with plenty of real maple syrup (650 calories)

The template contains a series of XSLT commands that begin with "xsl:". The commands match the XML tags, replace them with HTML tags, and place the data inside the new tags so that it will all render nicely in a browser. To accomplish this, the template performs the following steps.

1. Find the outside block tag ("food").
2. Open an HTML paragraph with a teal background and white, bold text.
3. Find the dish's name and output it inside the paragraph, followed by a dash.
4. Find the dish's price and output it after the dash, then close the paragraph.
5. Open a new paragraph with default text characteristics.
6. Find the dish's description and output it inside the paragraph.
7. Find the dish's price and output it, surrounded by parentheses, then close the paragraph.

This is, of course, a very simple example, but it is structured so that the processing sequence is fairly obvious. In fact, that XSLT processing sequence – match XML tags, change them to HTML tags, and then output the HTML tags and data – remains the same regardless of the complexity of the template.

## ***A Real World Example***

Let's look at another example, this time using a more realistic XML snippet, the Shipment Header from a NAMM Advanced Shipping Notice (ASN). Notice the XSLT reference on the first line.

```
<?xml-stylesheet type="text/xsl" href="asnpartial.xsl"?>
<ShipmentHeader>
  <ShipmentId>11111</ShipmentId>
  <Shipped>2009-05-07</Shipped>
  <EstDeliver>2009-05-10</EstDeliver>
  <Supplier>
    <PartyId>00000000000001</PartyId>
    <Name>Music Distribution Center</Name>
    <Address>
      <Address1>1 Central Ave</Address1>
      <City>Melville</City>
      <State>NY</State>
      <PostalCode>11747</PostalCode>
      <Country>USA</Country>
      <CountryCode>US</CountryCode>
    </Address>
  </Supplier>
  <ShipFrom>
    <PartyId>00000000000001</PartyId>
    <Name>Music Distribution Center</Name>
    <Address>
      <Address1>1 Central Ave</Address1>
      <City>Melville</City>
      <State>NY</State>
      <PostalCode>11747</PostalCode>
      <Country>USA</Country>
      <CountryCode>US</CountryCode>
    </Address>
  </ShipFrom>
  <SoldTo>
    <PartyId>112</PartyId>
    <Name>Main Street Music</Name>
    <Address>
      <Address1>1 Main St</Address1>
      <Address2 />
```

```

    <City>Any Town</City>
    <State>CA</State>
    <PostalCode>90210</PostalCode>
    <Country>USA</Country>
    <CountryCode>US</CountryCode>
  </Address>
</SoldTo>
<ShipTo>
  <PartyId>112</PartyId>
  <Name>Main Street Music</Name>
  <Address>
    <Address1>1 Main St</Address1>
    <Address2 />
    <City>Any Town</City>
    <State>CA</State>
    <PostalCode>90210</PostalCode>
    <Country>USA</Country>
    <CountryCode>US</CountryCode>
  </Address>
</ShipTo>
</ShipmentHeader>

```

Although the XML is a bit lengthy, it just contains the heading information (Document ID, Shipment ID, Shipped Date, and Estimated Delivery Date), and the basic seller and buyer information (Supplier, Ship From, Sold To, and Ship To). In a human-readable document, this information should probably appear in some sort of fixed format; perhaps as a list of the first group of items followed by a table containing the last four groups of items, like this.

**Id:** 2E944666-F10B-4B38-912A-28DE0B88D75D

**Shipment Id:** xxxxxxxx11111

**Shipped Date:** 2009-05-07

**Estimated Delivery:** 2009-05-10

<b>Supplier:</b> 00000000000001 Music Distribution Center 1 Central Ave Melville, NY 11747	<b>Ship From:</b> 00000000000001 Music Distribution Center 1 Central Ave Melville, NY 11747
<b>Sold To:</b> 112 Main Street Music 1 Main St Any Town, CA 90210	<b>Ship To:</b> 112 Main Street Music 1 Main St Any Town, CA 90210

In fact, this exact result can be achieved fairly easily using XSLT. Working in the same way as the waffles example above, the XSLT template must match specified XML tags and output them as HTML tags with their data values appropriately embedded. Look at this section of the XSLT file ("asnpartial.xsl", referenced in the XML file above) containing a template that processes the heading information.

```

<xsl:template match="ShipmentHeader">
<table border="0">
  <tr>
    <th style="font-size:15pt; text-align:right">Id:</th>
    <td style="font-size:15pt; text-align:left"><xsl:value-of

```

```

        select="Id"/></td>
</tr>
<tr>
    <th style="font-size:15pt; text-align:right">Shipment Id:</th>
    <td style="font-size:15pt; text-align:left"><xsl:value-of
        select=" ShipmentId"/></td>
</tr>
<tr>
    <th style="font-size:15pt; text-align:right">Shipped Date:</th>
    <td style="font-size:15pt; text-align:left"><xsl:value-of
        select="Shipped"/></td>
</tr>
<tr>
    <th style="font-size:15pt; text-align:right">Estimated Delivery:</th>
    <td style="font-size:15pt; text-align:left"><xsl:value-of
        select="EstDeliver"/></td>
</tr>
</table>
<table border="1">
    <tr>
        <td style="width:400px">
            <table border="0">
                <tr>
                    <th>Supplier:</th>
                    <td><xsl:value-of select="Supplier/PartyId"/></td>
                </tr>
                <tr>
                    <td></td>
                    <td><xsl:value-of select="Supplier/Name"/></td>
                </tr>
                <tr>
                    <td></td>
                    <td><xsl:value-of
                        select="Supplier/Address/Address1"/></td>
                </tr>
                <tr>

            <xsl:text> </xsl:text>
            <xsl:value-of select="SoldTo/Address/PostalCode"/>
          </td>
        </tr>
      </table>
    </td>
    <td style="width:400px">
      <table border="0">
        <tr>
          <th>Ship To:</th>
          <td><xsl:value-of select="ShipTo/PartyId"/></td>
        </tr>
        <tr>

```

```

        <td></td>
        <td><xsl:value-of select="ShipTo/Name"/></td>
    </tr>
    <tr>
        <td></td>
        <td><xsl:value-of
            select="ShipTo/Address/Address1"/></td>
    </tr>
    <tr>
        <td></td>
        <td>
            <xsl:value-of select="ShipTo/Address/City"/>
            <xsl:text>, </xsl:text>
            <xsl:value-of select="ShipTo/Address/State"/>
            <xsl:text> </xsl:text>
            <xsl:value-of select="ShipTo/Address/PostalCode"/>
        </td>
    </tr>
</table>
</td>
</tr>
</table>

```

This may look like a lot of complex code, but notice that most of it is plain HTML – the HTML that we want the template to output to the browser. The XSLT commands ("xsl:") merely pick out specific pieces of XML data and place them into the HTML output at the appropriate places. To accomplish this, the template performs the following steps.

1. Find the outside block tag ("ShipmentHeader").
2. Open a table to contain the main heading information.
3. Find the Id, ShipmentId, Shipped, and EstDeliver values and output them in four table rows with appropriate leading text, justified right and left within their table cells.
4. Close the table.
5. Open a new outer table to contain the two groups of seller information, "Supplier" and "Ship From".
6. For the first group, open a "nested" table (a table within a table) inside the left-hand outer table cell.
7. Find the name and full address values for the group and output them in four table rows with appropriate leading text on the first row. (Notice that the City, State, and PostalCode values are combined into one row, separated by commas and spaces.)
8. Close the nested table.
9. Repeat steps 6-8 for the other group in the right-hand outer table cell.
10. Close the outer table.
11. Open a new outer table to contain the remaining two groups of buyer information, "Sold To" and "Ship To".
12. For the first group, open a "nested" table (a table within a table) inside the left-hand outer table cell.
13. Find the name and full address values for the group and output them in four table rows with appropriate leading text on the first row. (Notice that the City, State, and PostalCode values are combined into one row, separated by commas and spaces.)
14. Close the nested table.
15. Repeat steps 12-14 for the other group in the right-hand outer table cell.
16. Close the outer table.

As before, to see the person-friendly version of the data, the XML file is simply opened in a browser, which detects the XSLT reference, applies the template, and displays the result. Thus, by "reading" the

XML code and data from a file and then "writing" the HTML code and data into the browser window, the XSLT template does in fact *transform* the information from one format to another.

## Learning More

Of course, working XSLT files in a production environment are significantly more complex than these examples. While it is up to your technical staff to develop transforms that suit your corporate image using your own formatting, logos, and styles, NAMM provides additional information and maintains some sample XSLT transforms at <http://www.namm.org/initiatives/b2b/docs/xslt-transforms-guide>. On that page, you can open some XML files that use pre-written XSLT transforms to get an idea of what is possible, and you are welcome to download the XSLT files and modify them as you wish.

**Note:** You must be logged in to the NAMM site to access the XSLT transforms page. If you have an account, you may sign in here: <https://www.namm.org/user>; if you do not have an account, you may create one here: <https://www.namm.org/user/register>. NAMM web site accounts are free.

The screen shot below shows a sample invoice transformed by one of NAMM's example XSLT files. Notice that it uses header formatting similar to the ASN example above.
